

Forged Products

Matecs supplies forged products for use in the dredging, shipbuilding and/or mechanical engineering industries, among others. These forged products are perfected with great precision at the Matecs plant using a range of metal working techniques perfected to great precision and are usually ready for immediate use. For example, Matecs produces machine shafts for a very varied range of applications.

We produce and supply complete products but can also carry out various kinds of machining on material or products supplied by the customer. As an extra service, we can carry out any chemical and mechanical tests required. We can also have products tested and certified by an independent certification agency. Matecs is often contacted to supply complete products, especially if short delivery times are required, but also for machining or overhaul jobs. Depending on the specific wishes of the customer and the final load of the material in its application, Matecs can manufacture products of both high and low alloys of forged steel.

Good contacts with the end users of our products and close cooperation with various supplying companies and technical partners enables us to think with you to devise and provide a solution. This entire process, from advising, devising and solving, buying, producing and processing to inspecting, testing and supplying best illustrates what Matecs stands for: a full and flexible service.

Product range

Application areas

The dredging, shipbuilding, petrochemical, mechanical engineering and food industries.

The product range includes:

- Various shafts, such as pump shafts, propeller shafts and cutter shafts.
- Rolling mill roles, pistons. Rudder shafts and forged rings.
- Custom-made products, various machining options, repair and overhaul.
